Metadata manipulation in a.txt format is very popular among users, as it can be added to each piece of data, such as images and videos, in a very simple and effective way. Metadata allows you to create a new document which offers several file attributes and properties, such as the author, the creation date, the format, the filename, and the size, to name just a few. The Html class offers information about the document created and its visual aspect, while the Text class is related to the document's content, as it has all the metadata you wish to offer. Both classes are linked to the set of fields above. Besides, the PDF class provides an exact preview of the document, including the visual aspect. In order to create the file, you only need to attach metadata to the PDF and add the created document to the library. The library allows you to manage the documents with ease, in a way that suits your needs. You may also add time stamps, remove or add pages to the created document, as well as perform the set of operations linked to your particular task. You may create new files and associate them with a particular document. You may also perform all the operations you wish from the library. Most of the operations performed on the created documents are performed in an easy way, by using the drag and drop interface. Once the required file is available, the options and operations are displayed in the main window. One of the main features of the application is that it can manage multiple files at the same time. You can perform the required operations, while the activity log shows the progress of each of the steps and the status of all of them. Moreover, you may stop or resume a particular task and all of them at any time. The library also keeps a log of the operations performed, which can be inspected as a tab in the main window or from the 'Help' section. Additionally, the activity log offers the option of file permissions. After you modify the file, you may save the new version, or disable the option, to take control over it or others, when you wish. You may also choose between uploading the file or using the built-in web server, where you may upload the file through FTP or SFTP. The FTP is the only option when working with remote files, and if you wish to export the file to a remote server, you need to use this method. The SFTP offers access over a secure channel, and it
